

**Bumax is Bufab's registered trademark, known as the strongest stainless steel fastener in the world.**

Bumax is manufactured in Bufab's own plants in Sweden and meets the requirements of high demanding customers when it comes to quality, corrosion resistance, high strength, fatigue strength, traceability and heat resistance. We deliver

safety and reliability. Some of the products in the Bumax-family are completely unique that cannot be found anywhere else on the market. All products have full traceability (3.1 certificates available for each item) and are sourced solely from premium European stainless steel manufacturers according to rigid specifications.

## BUMAX<sup>®</sup> GRADES Other special grades can be offered on request

**BUMAX 88** offers better corrosion resistance than standard A4 due to higher molybdenum content. Bumax 88 is a very consistent material that offers higher yield strength and lower amount of inclusion than standard A4 fasteners, that gives superior mechanical properties and fatigue resistance. Bumax 88 fasteners are used in many applications that demands very low magnetic permeability, it has lower magnetic permeability and less variation from batch to batch compared to standard A4 fasteners.

**BUMAX 109** is the strongest A4 bolt on the market. Same material as Bumax 88 but higher strength due to special manufacturing process.

**BUMAX Nitro**, austenitic stainless steel with high nitrogen content, characterized by very high strength and fatigue resistance, in combination with good corrosion resistance. Excellent material for marine application and can be supplied in strength class 12.9 up to M42.

**BUMAX Super Austenite (SA)**, high-alloy austenitic stainless steel for seawater and other aggressive chloride bearing medias. Excellent resistance to general, crevice, pitting and stress corrosion.

**BUMAX Lean Duplex (LDX)** offers economical solution for high strength fasteners in medium corrosive environments.

**BUMAX Duplex (DX)** are characterized by excellent strength, ductility and fatigue resistance in combination with good general, pitting, crevice and stress corrosion properties.

**BUMAX Super Duplex (SDX)** are characterized by excellent mechanical properties and very good corrosion resistance. Excellent resistance to general crevice, pitting and stress corrosion in chloride bearing medias.

**BUMAX Hyper Duplex (HDX)**, a groundbreaking alloy used in the most demanding applications. Suited for use in severe corrosive environments such as hot chlorinated sea-water and for aggressive acidic chloride containing media in chemical, oil/gas, marine and petrochemical industry.

**BUMAX Ultra**, a unique precipitation hardenable stainless steel that can be delivered in ultra high strength levels. Strongest stainless steel fastener on the market. Good corrosion resistance in chloride environments.

**BUMAX Heat (HE)**, high temperature resistant material for applications requiring high strength and good oxidation resistance at temperatures up to 700°C. Can be precipitation hardened.

**BUMAX Heat Plus (HEP)**, precipitation hardenable high temperature resistant material with excellent oxidation resistance and high tensile and creep properties at temperatures up to 815°C.

## CHEMICAL COMPOSITION Nominal wt%

GRADE	EN	UNS	Microstructure	C max	Cr	Ni	Mo	Other	PRE <sup>1)</sup>

<sup>1</sup> Bumax Ultra is a grade that is tailor made to solve customer needs in regards of strength, ductility, fatigue and wear resistance. Values in the table are typical strength values, but even higher strength levels can be achieved on some designs and dimension, up to tensile strength levels of 2500 MPa.

<sup>2</sup> On request

The data shown in the table are typical and are representative for the majority of standard fasteners. May be subject to alterations, depending on size and design.

## PROPERTIES AT LOW AND HIGH TEMPERATURES

It is important to understand what happens with the fastener material when operating at elevated temperatures for prolonged times. Properties such as thermal expansion, strength, ductility, corrosion resistance and fatigue resistance are affected by high temperatures and its effect on the jointed application must be considered from case to case. The diagram to the right shows typical yield strength losses that instantly occur in the material when exposed to high temperatures. Property changes during prolonged service at elevated temperature must also be considered. Gas corrosion at high temperature is totally different compared to wet corrosion at lower temperatures. Furthermore, changes in mechanical properties might gradually change over time due to ageing and creep deformation. Ageing that occurs in all stainless steel material over time is enhanced by high stresses in the material in combination with high temperature or temperature fluctuations, and can lead to ductility losses in the material. Creep deformation is a slow plastic deformation under the influence of mechanical stresses. It can occur as a result of long-term exposure to stresses that are still under the yield strength of the material and the effect increases at higher temperatures. Bumax HE and Bumax HEP are high temperature resistant grades optimized for high temperature conditions and are much more stable against ageing, gas oxidation, creeping and strength losses compared to regular stainless steels.

An increased brittleness at subzero and especially cryogenic temperatures is characteristic of all steels and metals in general. Some steel grades become more brittle than others at cryogenic temperatures below -150°C. This depends mainly on microstructure, chemical composition and internal stress. Austenitic stainless steels has generally better impact strength at very low temperatures than Duplex, Ferritic and Martensitic stainless steel.

To understand the environment and application requirements is therefore crucial. Your local Bumax sales representative will help you selecting the right material.

☼ No corrosion under normal conditions ● Not suitable, corrosion is likely to occur

● Possible risk of corrosion, but the steel grade might be suitable depending on requirement, environment, design and maintenance.

Low: Mild condition, such as low concentrations at low temperatures. High: Severe condition, such as high concentrations at elevated temperatures.

## PRELOAD AND TIGHTENING TORQUE

Preload is needed to keep the jointed part together and function correctly for long periods of time, resisting both static and dynamic loads.

The combined stresses in the joint should normally not exceed the yield strength of the fastener. In practical use the recommended pretension vary between 50-80% of the yield strength  $R_{p0.2}$ . Tightening torque is needed to achieve the necessary preload. The recommended tightening torque depends on many parameters such as friction, fastener strength, thread diameter, screw type and tightening procedure. The recommendation used for Bumax products are based on a targeted preload of about 65-70% of the yield load and a friction coefficient of 0.14-0.16, which can only be obtained by a burr-free surface and using high quality lubrication. Recommended preload and tightening torque data can be found at [www.bumax.se](http://www.bumax.se).

# BUMAX® HARD TAPTITE THREAD-FORMING SCREW

Bumax Hard Taptite is a thread-forming screw which forms its own thread during assembly because of its trilobular shape, its conical entry thread and its excellent surface hardness. Bumax Hard Taptite is suitable for assembly in structural steel and cold rolled stainless steel with hardness up to 200 HV.

Taptite trilobular geometry

C=External circle diameter D=Trilobular diameter  
E=Internal circle diameter K=Ovality

# BUMAX® HARD SELF-TAPPING SHEET METAL SCREW (ST)

Bumax Hard self-tapping screw with ST thread is designed for use in structural steel and cold rolled stainless steel with a maximum hardness of approximately 200 HV.

All Bumax Hard products exhibits excellent surface hardness and are made with the same steel grade as Bumax 88. Bumax Hard is a great and cost-efficient solution for fitting to sheet metal and profiles.

# BUMAX® LOCK

Bumax Lock is an all-metal lock nut made out of the same steel grade as Bumax 88. It is equipped with a specially designed thread profile that locks when it is tightened, distributing the stresses along the entire nut thread. This allows better load distribution which in turn produces greater gripping strength.

Tensile stress

Fig 3. Residual stress

# BUMAX® GRADE SELECTION CROSS

Stainless steel fasteners have properties which make them attractive choices for a wide range of applications. It is essential to consider the required properties such as corrosion resistance, temperature resistance, mechanical strength and magnetic permeability. Correctly chosen material will guarantee a trouble-free life time and low life cycle cost.

Grade selection cross helps you select the best material suited for your needs.
